# Special Angles and Parallel Lines

Interior angles lie between the two lines.

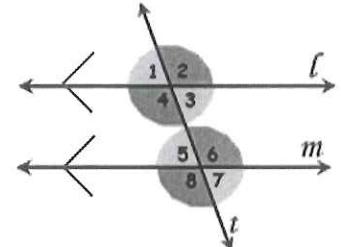

Alternate Interior angles are on the opposite sides of the transversal  
Example:  $\angle 3$  and  $\angle 5$

Consecutive Interior angles are on the same side of the transversal.  
Example:  $\angle 3$  and  $\angle 6$

Exterior angles lie outside the two lines.

Alternate Exterior angles are on the opposite sides of the transversal. Example:  $\angle 2$  and  $\angle 8$

Corresponding angles are angle in the Exterior and the other in the Interior but on the same side of the transversal. Example:  $\angle 8$  and  $\angle 4$

### Use these properties!

|| lines form  $\cong$  alternate interior angles.

|| lines form  $\cong$  alternate exterior angles.

|| lines form  $\cong$  corresponding angles.

|| lines form supplementary consecutive interior angles.

$\cong$  alternate interior angles form || lines.

$\cong$  alternate exterior angles form || lines.

$\cong$  corresponding angles form || lines.

Supplementary consecutive interior angles form || lines.

### Practice Example:

$s \parallel t$  and  $c \parallel d$ .

Name all the angles that are congruent to  $\angle 1$ .

Give a reason for each answer.

$\angle 3 \cong \angle 1$  corresponding angles

$\angle 6 \cong \angle 1$  vertical angles

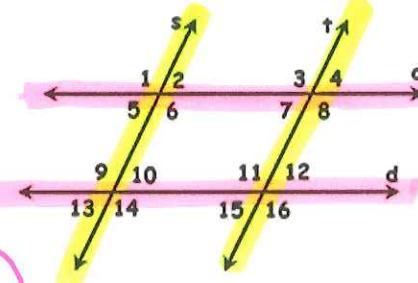

$\angle 8 \cong \angle 1$  alternate exterior angles

$\angle 9 \cong \angle 1$  corresponding angles

$\angle 14 \cong \angle 1$  alternate exterior angles

$\angle 11 \cong \angle 9 \cong \angle 1$  corresponding angles

$\angle 16 \cong \angle 14 \cong \angle 1$  corresponding angles

must use // lines  
form...

# Parallels Cut by a Transversal- In Class Practice:

Directions: Use the figure to name the relationship between the two angles.

1. Angles 1 and 2

$\angle 1 + \angle 2 = 180^\circ$  linear pairs  
are Suppl.

2. Angles 4 and 2

$\angle 4 \cong \angle 2$  vertical  $\angle$ s  
are  $\cong$ .

3. Angles 5 and 3

$\angle 5 \cong \angle 3$  // lines form  
 $\cong$  alt. int.  $\angle$ s.

4. Angles 1 and 7

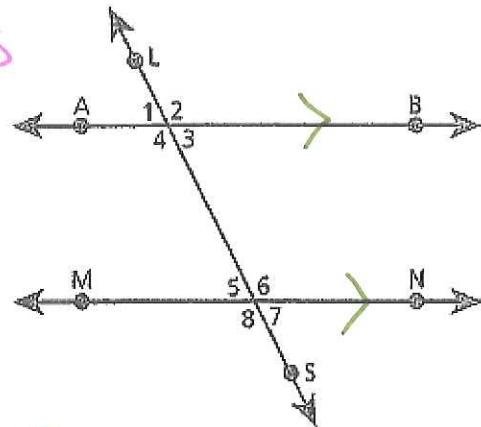

$\angle 1 \cong \angle 7$  // lines form  $\cong$   
alt. ext.  $\angle$ s.

5. Angles 8 and 4

$\angle 8 \cong \angle 4$  // lines form  $\cong$  corr.  $\angle$ s.

6. Angles 6 and 3

$\angle 6 + \angle 3 = 180^\circ$  // lines form Suppl. consecutive  
int angles.

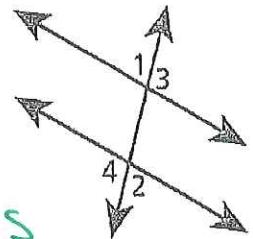

Directions: Use the figure to name the relationship between the two angles assuming the two lines are parallel and find the measure of the angles if  $\angle 1 = 85^\circ$ .

7.  $m\angle 3 =$  95°

Because linear pairs are Suppl.

8.  $m\angle 2 =$  85°

Because // lines form  $\cong$  alt. Ext.  $\angle$ s

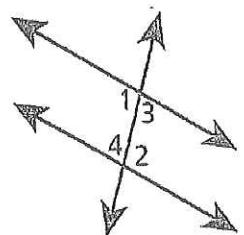

Directions: Use the figure to name the relationship between the two angles assuming the two lines are parallel and find the measure of the angles if  $\angle 1 = 110^\circ$ .

9.  $m\angle 3 =$  70°

Because linear pairs are Suppl.

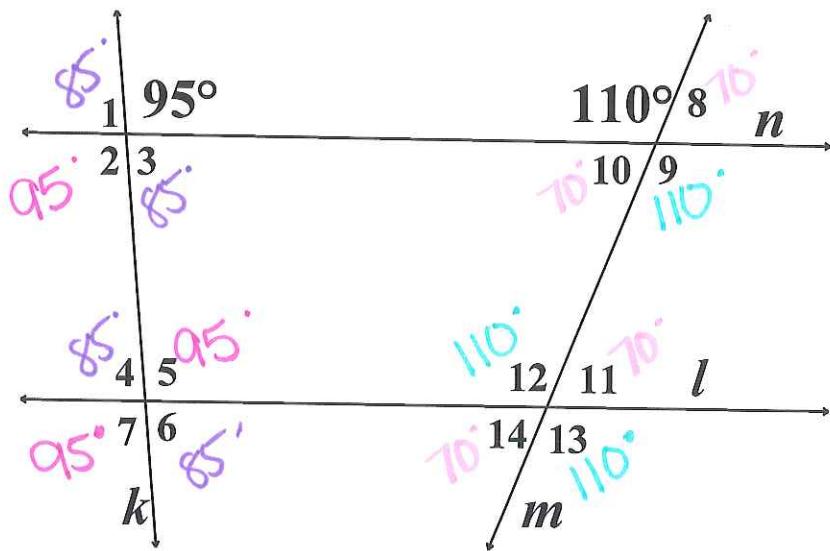

10.  $m\angle 2 =$  110°

Because // lines form  $\cong$  alt. int  $\angle$ s.

## Special Angles and Parallel Lines Practice

Find the missing angle measures if  $n \parallel l$ .

$$\angle 1 = \underline{\hspace{2cm}}$$

$$\angle 8 = \underline{\hspace{2cm}}$$

$$\angle 2 = \underline{\hspace{2cm}}$$

$$\angle 9 = \underline{\hspace{2cm}}$$

$$\angle 3 = \underline{\hspace{2cm}}$$

$$\angle 10 = \underline{\hspace{2cm}}$$

$$\angle 4 = \underline{\hspace{2cm}}$$

$$\angle 11 = \underline{\hspace{2cm}}$$

$$\angle 5 = \underline{\hspace{2cm}}$$

$$\angle 12 = \underline{\hspace{2cm}}$$

$$\angle 6 = \underline{\hspace{2cm}}$$

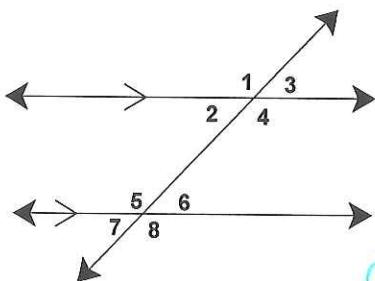

$$\angle 13 = \underline{\hspace{2cm}}$$

$$\angle 7 = \underline{\hspace{2cm}}$$

$$\angle 14 = \underline{\hspace{2cm}}$$

## Always, Sometimes or never!

For exercises 1-6, tell whether each statement is true or false using the figure below, then explain the relationship between the two given angles.

1.  $\angle 1 \cong \angle 3$  Sometimes.

$\angle 1$  and  $\angle 3$  are linear pairs  
so  $\angle 1 \cong \angle 3$  if they both are  $90^\circ$

2.  $\angle 8 \cong \angle 3$

Sometimes  $\rightarrow$   
they are not rotated. so  
 $\angle 8$  can  $\cong \angle 3$   
only if they Both  $= 90^\circ$ .

3.  $\angle 2$  and  $\angle 6$  are supplementary.

$\angle 2 \cong \angle 6$  because // lines form  
 $\cong$  alt. int.  $\angle s$  so they would only  
be suppl. if they  $= 90^\circ$

4.  $\angle 7$  and  $\angle 8$  are supplementary.

Always! Linear pairs are suppl.

5.  $m\angle 1 \neq m\angle 6$

Sometimes  $\rightarrow$  if they  
 $= 90^\circ$  then they can be  $\cong$   
most of the time  $\angle 1 \neq \angle 6$

6.  $m\angle 5 = m\angle 4$

Always // lines form  
 $\cong$  alt. int.  $\angle s$ !

It's not always as it seems!!! Use the picture to identify the parallel lines.

7. If  $\angle 1 \cong \angle 11$  then  $l \parallel m$  because  $\cong$  alt. ext.  $\angle s$  form // lines

8. If  $\angle 1 \cong \angle 7$  then  $n \parallel p$  because  $\cong$  alt ext  $\angle s$  form // lines.

9. If  $\angle 3 + \angle 10 = 180$  then  $l \parallel m$  because Suppl. Cons. int  $\angle s$  form // lines!

10. If  $\angle 7 \cong \angle 3$  then  $n \parallel p$  because  $\cong$  corr.  $\angle s$  form // lines.

11. If  $\angle 14 + \angle 7 = 180$  then  $l \parallel m$  because Suppl. Cons. int  $\angle s$  form // lines.

12. If  $\angle 1 \cong \angle 9$  then  $l \parallel m$  because  $\cong$  corr.  $\angle s$  form // lines.

13. If  $\angle 13 \cong \angle 11$  then  $n \parallel p$  because  $\cong$  alt. int  $\angle s$  form // lines.
